Lucas chess setup position

lucaschess.blogspot.com/ Hey I'm just starting to learn chess and I watched the fundamental controls in 1&2 videos and now I want to test what I learned by checkmating using Queen/Rook + King vs Lonely King. I checked the computer workout page in the learning menu, but I can't find the set/position I want to play. The analysis board and editor allow me to edit things, but I don't know if there's a way to play the computer from a setup position. Also, when I click on Play Against Computer in the playback menu, I can't find what I'm looking for. Is there a way that I can create my own custom set-up (and then have a computer play against me that's the case)? (I want to be able to place every piece anywhere on an empty board and then start playing against the computer in that set-up.) So I could place the white and black kings and the white queen to practice the mating king + queen vs king. Thanks UPDATE: I've got chess.com app on my iPad and if you play against the computer it has an option to setup the position and then play from there. This is just the opportunity I was looking for and it's perfect for doing exactly what I asked (except now I use the iPad everytime I want this... which is not so bad...) But, Is there anyway to do it on my computer(mac) instead of my iPad? Is this feature somewhere on the chess.com website? (I'm a diamond member.) Also, does anyone know if this feature is still available on the iPad app for free or once a premium membership has run out? Also, I downloaded sigma chess and exachess and bit to do what I want, but I can not find a way to change the difficult settings either of them and can be slow or just weird to work. Thank you for using our services. We are a non-profit group that runs this service to share documents. We need your help to make maintenance and repair of this website. In order for our site to run, we need your help to cover the cost of the server (about \$ 500/m), a small donation will help us a lot. Please help us to share our service with your friends. I use lucas chess software quite often, especially if this in-depth analysis of the game is mine. The chess position is used at the end of the evergreen game, for those who are curious. Why would you learn your own chess games? Analyzing your own chess games can be very difficult, especially if there is no step by step process. Yet this is one of the most important aspects of improving the game. In fact, the only thing I believe is more important to actually play the game. If you seriously improve your chess skills effectively, there really is no way around it. The reason why you go through the moves of a chess game is so important that some mistakes go unnoticed by both sides while playing. If all players never go through their moves, none will ever benefit from the mistake. The next time, similar situation arrives in a chess match, the same error occurs. Another reason why Chess games that will help you memorize common chess patterns. A simple example of this is common rook and king vs king checkmate. I saw a friend of mine who had to be enough for the draw because, frankly, he didn't know how to play this pattern. I showed him how to checkmate the king of the king and the rook, and he was surprised at how easy it was. Patterns of chess are an integral part of the game, and some of these frequent players don't even realize that they're playing with memory. Sample recognition has been enhanced by reviewing games regularly. Having a modus operandi makes it much easier to create this habit. If there is a clear process of doing something, it will be easier. The easier something, the more often the habit you will be ingrained in the chess training regimen. First of all, let's take a vote. Important note! Pictures of this tutorial on Google DriveHere are the pictures from the tutorial to help you follow along. Why they are also on this site, for some reason is not so clear. Therefore, I strongly recommend that you look out for the pictures you have stored here. What you need this tutorial To follow the tutorial, you need a program called Lucas Chess. This free software that allows users to create and open (.pgn) files quite easily. It also allows users to add comments and versions with ease. The version I'll be using is the latest release to date, which is V11.16. If you want, you can download the specific version, but I suggest you get the latest release, as lucas chess chess engines are also fairly recent versions. The last thing you need is a chess game, preferably yours. If you have a game of yours in pgn or pks format, you just need to open the Lucas chess and you're ready for the tutorial. To do this, click tools>pgn viewer>Read pgn (Image 2-1). Then find the file you want to open, select the game, and press the Edit button (2-2 pictures) if the steps are written on a paper score sheet, manually enter the steps by opening the program, clicking on the tools button, and clicking on the create your own game button (2-3 pictures). This allows you to make the steps manually, click on and space. Make sure the window is full-size, because if you don't, some of the options on the right may slide down. If you don't see the comments and variations section, right-click the first step and they'll appear. When everything is ready, Lucas chess should look like Picture 2-4. The game I will be analyzing ... Step 1: Basic Commenting & AnalysisThe first step in chess game analysis is to do basic commenting. This is where you comment on a move that you or your opponent has made. If you think there is a better move than the one in the game writes the move down the comment box. If you're not sure if a move is good or bad, make a note of this and save it often so you don't lose your job. It is very important not to use a chess engine in this step. Try position for yourself. If you're not sure which step is better, comment. (Picture 3-1) Later, when the computer analyzes the game, it's easy to see which moves it wasn't sure about. If you want to study the more complex position by moving the pieces around, you can easily do so by clicking on the blue appendix button on the variants (picture 3-2). A secondary window opens with the position without the step indicated by the arrow. This is because it is essentially added to an alternative to this step. It is unlimited how many variations and subversions can be given late in a certain step, however, in order to add the version of the game click on the accept button, not the Cancel button. (Picture 3-3) Once you've accepted the version, you can now see the markings in the variations section. Double-click the variant to re-view and edit the version window. (Pictures 3-4) When you're done with the basic analysis, the screen will look like this... (3-5 pictures) Notice the speech bubbles. This means that a comment or variation is added to the move. If they have a double speech bubble, it means that a comment and a version are added. I suggest going through all the moves that you have a version of and add some kind of comment to the comment box. A simple version is enough. The reason for this becomes clear in Article 3(1) and (2). Before we start the next save the file! Step 2: Let the chess engine analyze the game in this step we will use your computer to do an automatic analysis of the game. This allows you to catch some of the wrong moves that you may not have seen in the first step. This is done by clicking utilities>analysis (4-1 image). The Analysis Configuration field appears. Make sure the following settings are correct... (Picture 4-2) Duration of engine analysis (secs): 5 Number of steps assessed by the engine (MultiPV): 3 Repeating existing previous analyses (if any): The last element is very important, as if selected, it deletes the variants you have added. The other settings are ok by default. Now you can click Accept and you will begin checking every move of the game for possible mistakes. (Picture 4-3) When this is done, the Analysis Result field appears. (Picture 4-4) It gives you all sorts of statistics that are quite interesting to go through, however, it goes beyond the article that explains all this and actually has nothing to do with learning the chess game. So take a look, and when you're done, we'll continue with the 3rd. Note! You can view the artwork at any time later by clicking

Utilities>Analyze>Show Pictures. Step 3: Compared to the moves of the computer analysis, as you've probably noticed when the chess engine analyzes the game to color code each step (Picture 5-1). The following list shows the meaning of each color... Red - Flat out Yellow - Inaccurate Grey - Neutral (no (but not the best move) Blue - The best move according to the computer. Purple (Rare) - Brilliance (Basically a step so good, even the computer has not seen it.) These are the color codes I like best in Lucas Chess. However, if you save gestures to the normal (png) file, the color codes disappear when you reopen the file. Saved as pks to save color codes and graphics displayed at the end of the analysis. This goes to the Utilities menu and goes to save>PKS Format (picture 5-2). The rest is like saving a file in general. Now we are ready to compare moves with the computer. Remember the speech bubbles? Now they do every move because the chess engine automatically add the analysis to the variants. Some move double bubbles, these are the ones where he personally commented on the move and added a version of his own. Remember when I said each version added a step, can I add a comment? Now you can easily tell which movement you've personally studied! (Picture 5-3) The difference between versions of your computer and your versions is that some labels are labeled. Mine is the McCain X3 32bit, which means that the version was created by McCain's chess engine. Personal variations are not tagged and are usually in front of others. To play in any version, you simply need to double-click. I suggest we compare the changes made by analyzing your computer. That way, you know, if you think about the analysis right. If the analysis is different, it's not best to figure out why. A good way to do this is to play in a position against the computer. Besides the blue append button used to add a version there is a brown Append + Engine button that allows you to do this (Picture 5-4). Don't worry about the engine rating score (Picture 5-3) too much. If the difference between two chess moves is 0.4 points or less, you can safely consider them equal. A whole point is roughly the same as a pawn, so 2/5 on a foot doesn't make much difference unless you're not human or just barely (i.e. Magnus Carlsen). The last and last thing you want to do is to study this in-depth chess game of yours in full to go through all the bad moves that you missed in Game 1. The inaccuracies will be harder to figure out so you don't get lost. If you spend more than 15-20 minutes trying to figure out why this move is better than this and there's no progress to show it, you'd probably better leave it alone or consult a chess specialist. Special tips... Wow! I've made it to the end of the tutorial. If you followed the tutorial correctly, you're a better chess player now than you were in the beginning. If you constantly analyze the chess game consistently, I guarantee that you will see improvements in the game. Here are some special tips to help you. Avoid excessive analysis. When it comes to a chess engine, it's very simple. They can calculate dozens of steps in seconds. You'll never understand the whole thing... A real chessboard. Many masters insist on this. You are able to Connect a dgt smart board to Lucas chess and add variants like this. Save your positions where you made a mistake in solving them later. At first, you don't remember everything. Repetition is what is ingrained in these samples. Analyze professional games with this method. Studying professionals is very rewarding, especially if they also get notes. Let the good times roll. That's what chess is all about, isn't it? © 2020 ProjectResoluteCommentsSuresh sandaruwan on June 06, 2020:Wooo w w
